oneLink

Description

ORACLE | micros

Connect What Matters. Nothing More.

oneLink is the integration hub for oneSystem, providing standardized and custom connections to third-party tools and applications. It routes orders and data safely into oneSystem while preserving operational boundaries and system integrity.

What oneLink Does

oneLink acts as a controlled gateway between oneSystem and external platforms. It translates, validates, and routes data without exposing core systems or introducing tight coupling.

- Central integration hub for third-party systems
- Supports standardized and custom integrations
- Routes orders and data safely into oneSystem
- Explicit interfaces with clear ownership boundaries
- Designed to evolve without disrupting operations

Architectural Principles

oneLink is designed to isolate change. External systems can integrate without forcing architectural changes inside oneSystem.

- Clear separation between core systems and integrations
- No third-party access to store transaction ownership
- Controlled routing and validation of inbound data
- Integration failures do not affect store operations

How oneLink Fits into oneSystem

oneLink connects external platforms to oneNumber, onePOS, oneNet, and oneServer while preserving the integrity of each component. Integrations remain optional, controlled, and replaceable.

Designed for long-term flexibility, oneLink enables integration without compromise.
